SUMMARY

Product-focused Software Engineer bridging the gap between high-performance systems engineering and modern frontend architectures. Deeply experienced in the Go and TypeScript ecosystems. I specialize in building developer tools, secure infrastructure, and end-to-end full-stack products that prioritize both developer experience and end-user impact.

CORE COMPETENCIES

- **Languages:** Go, TypeScript, JavaScript, Python
- **Frontend:** React, Next.js, Astro, TanStack Start, Tailwind CSS
- **Backend & Infrastructure:** Hono, FastAPI, Cloudflare (Workers/D1/R2/KV/Durable Objects), Redis, PostgreSQL, Turso, SQLite, Docker, CI/CD
- **Specialized:** AST Manipulation, Cryptography (AES-256-GCM, Argon2), Terminal UI (Bubble Tea)

EXPERIENCE

Backend Developer | GoLodge

May 2025 – Present | Remote

- Architected and implemented a robust booking system handling partial payments and complex multi-role authorization logic (Host, User, Admin).
- Designed and engineered a fully serverless, highly-available backend on Cloudflare using Hono, Turso, and Drizzle ORM.
- Implemented robust security policies, including strict cookie handling, edge-level DDoS protection via Cloudflare, and privacy-safe external API integrations.
- Integrated enterprise tooling including Better-Auth for identity, PostHog for product analytics, and Sanity CMS for blog content delivery.

Fullstack Developer | Testgraders

March 2025 | Freelance

- Led end-to-end architecture and deployment of a global IELTS practice grading platform utilizing Next.js and Hono.
- Built a highly scalable backend architecture utilizing Cloudflare's complete serverless stack (D1, R2, KV, Durable Objects) to handle complex audio/video media uploads and global traffic routing.
- Engineered a proprietary, fair-distribution algorithm to balance grader workloads and designed a bi-directional review system for quality control.
- Delivered a high-performance frontend using TanStack Table to handle large grading datasets and custom Shadcn/UI for a seamless user experience.

Fullstack Developer | PelzSecret

February 2025 | Ibadan, Nigeria

- Re-architected a static web template into a high-performance, dynamic e-commerce frontend using Astro.
- Integrated comprehensive backend APIs and secure payment gateways to establish a resilient, end-to-end checkout flow.

TECHNICAL PROJECTS (OPEN SOURCE)

venndor | Go, Cobra, Node.js, AST

[GitHub](#)

- Built a high-performance CLI tool to securely vendor npm packages directly into a repository as owned source code.
- Engineered intelligent package manager detection and non-destructive AST manipulations to seamlessly integrate with

native workspace configurations.

- Implemented robust offline Diff & Patch generation enabling developers to commit local hacks/fixes that automatically re-apply over upstream version bumps.

zEnv | *Go, TypeScript, TanStack Start, Redis, PostgreSQL, Docker*

GitHub

- Engineered an end-to-end zero-knowledge secret management platform utilizing AES-256-GCM and Argon2 encryption.
- Built a high-throughput, self-hostable Go backend to manage encrypted secrets and team-based RBAC.
- Developed a native CLI tool for zero-friction CI/CD secret injection, paired with a modern TanStack Start dashboard featuring a custom client-side crypto engine.

go-ytm | *Go, Python, Bubble Tea, FastAPI, SQLite*

GitHub

- Designed a feature-rich, terminal-based YouTube Music player utilizing a complex hybrid architecture.
- Built an ultra-fast Go TUI (Terminal User Interface) with Vim-like keybindings, communicating with an isolated Python sidecar for robust YouTube API extraction.
- Engineered offline caching systems and native Kitty terminal integrations to render high-resolution album art entirely within the terminal.

EDUCATION

Self-Taught Engineer / Active Open-Source Contributor
